

Flood Plain Management

the past is prologue

Wayne Gieselman
Administrator, Environmental Services
Division

Comprehensive Flood Plain Management Program

- Flood plain maps
- Engineering and permitting expertise
- Local program oversight and assistance
- Dam permitting
- Safety compliance and inspections
- Disaster response

Fully funding a comprehensive program
would cost \$3 million per year

Floods happen

They always will

- Serious flooding has occurred in 8 of the last 15 years
- Resulting in 8 Presidential Disaster Declarations in Iowa

The public costs of flooding

- Demand for publicly-funded flood control works
- Rescue and relief efforts
- Interruption of commerce, tax base
- Damage to public facilities
 - Roads and bridges
 - Water, waste water treatment plants
 - Public records
 - Critical facilities like hospitals

Modify flooding: *the “structural” approach*

- Dams and reservoirs
- Levees and floodwalls
- Channel changes
- Land treatment (watershed management)
- Onsite detention (e.g., “upland” storage ponds)
- All have some limitations
 - physical constraints
 - cost
 - environmental
 - limited design life
 - legal, etc.

Modify flooding: *the “structural” approach*

State

➤ DNR

- Authority to construct flood control works (455B.264)
goes back to 1949 (Iowa Natural Resources Council)

Local

- Local governments
- Drainage and levee districts
- Soil and water conservation districts
- Flood control districts
- Water resource districts (authority sunsetted circa '88)

Partner with federal Corps of Engineers, Natural Resources
Conservation Service and Federal Emergency Management Agency

Modify susceptibility to flooding: *the “non-structural” approach*

- Floodplain regulations
- Development / redevelopment policies
- Flood proofing (retrofit existing buildings)
- Disaster preparedness
- Flood forecasting / warning

Current Picture

➤ Local Programs

- Only 136 communities with delegated programs
 - Lack of training and expertise
 - Lack good data and maps to do planning

Current Picture

➤ NFIP

- 600 of 947 cities have flood hazard areas identified by FEMA
- Only 10 – 20% of damaged buildings covered by NFIP
- 129 communities have maps but do not participate in NFIP

Current Picture

➤ Misunderstood Risk

- Few people have flood insurance buildings outside the 100-year flood plain
- Property owners may not know risk

- *“You’re not in the flood plain”*

Current Picture

- 2008 floods far exceeded 100 year flood in many areas
 - Difficult to justify flood protection policies based on such a large, rare event

“You don’t build a church to hold the Easter crowd.” former Iowa Water Commissioner

- But you have to expect the Easter crowd to show up and plan for it.

Current Picture

➤ Maps

- Only about 1/3 of state has accurate up to date maps
- Most only show 100 year flood plain
 - Few digital maps
 - Not accessible to planners
 - Cannot be incorporated into other computer tools (i.e., CAD, GIS)
 - Not easily updated

Flood Plain Management

- Planning done by local communities
- Plans should...
 - Guide wise development decisions
 - Be based on high quality data
- Promote flood insurance

Flood Plain Management

➤ State's Role

- State-wide management plan
 - Identify high risk areas
- Regular training for local officials
- State-wide technical standards
- Oversight of local permitting programs

Flood Plain Management

➤ Mapping Program

- Use LiDAR topography data already acquired
- Detailed flood studies
- Digital flood maps for entire state

LiDAR + Flood Study = Digital Flood Map

Comprehensive Flood Plain Management Program

- Flood plain maps
- Engineering and permitting expertise
- Local program oversight and assistance
- Dam permitting
- Safety compliance and inspections
- Disaster response

Fully funding a comprehensive program
would cost \$3 million per year
